Chloride Water Quality Trading

Marco Graziani

# What is Water Quality Trading?

- Many different sources of pollutants affect water quality in a watershed
- Pollutant load reductions beyond legally required levels can generate water quality trading credits
- A portion of a wastewater or stormwater permit's pollutant load reduction responsibilities can be offset by pollutant load reductions achieved elsewhere in the watershed
- Pollutant load reductions must exceed the credits made available to the buyer – addressed through trade ratios
- Credits are calculated to benefit the buyer's immediate receiving water or specific downstream waterbodies
- Trading can be a cost-effective pollutant load reduction alternative for permitted wastewater and stormwater sources
- Nonpoint source credits can result in ancillary benefits beyond the pollutant offset
- Trading can help accelerate the implementation of voluntary nonpoint source BMPs by providing additional funding sources for practices designed to improve water quality
- Trading can also result in “demand” for BMPs to be established in specific locations that will result in a greater volume of water quality credits
- Water quality trading is a tool, not a goal

# Summary of important trading concepts

## Water quality trading models

Source: <https://www.epa.gov/sites/production/files/2016-04/documents/wqtradingtoolkit.pdf>

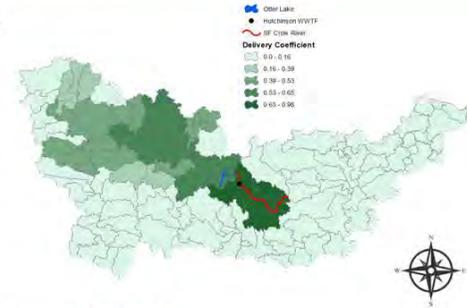

## Baselines

## Credit quantification

- Credit value is based on the expected pollutant load reduction at the waterbody of concern
- Credit quantification – allows for sampling and modeling
- Considerations include edge of field delivery, pollutant fate and transport, temporal variability and any conditions specific to the water quality standard and/or watershed modeling assumptions

## Trade ratios

- Trade ratios are used to account for uncertainty and ensure water quality benefit
- Default trade ratios are low for wastewater generated credits because effluents are monitored and uncertainty is low
- Stormwater generated credits have moderate uncertainty because BMPs are not monitored (effluent quality) but they are subject to permit requirements (inspection, maintenance)
- Nonpoint source generated credits have high uncertainty because BMPs are not subject to permit requirements

Default Trade Ratios:	Credits Users (Buyers)	
	NPDES Permittees	
Credit Generators (Sellers)	Wastewater NPDES	1.1:1.0
	Stormwater NPDES	2.1:1.0
	Nonpoint Source	2.6:1.0

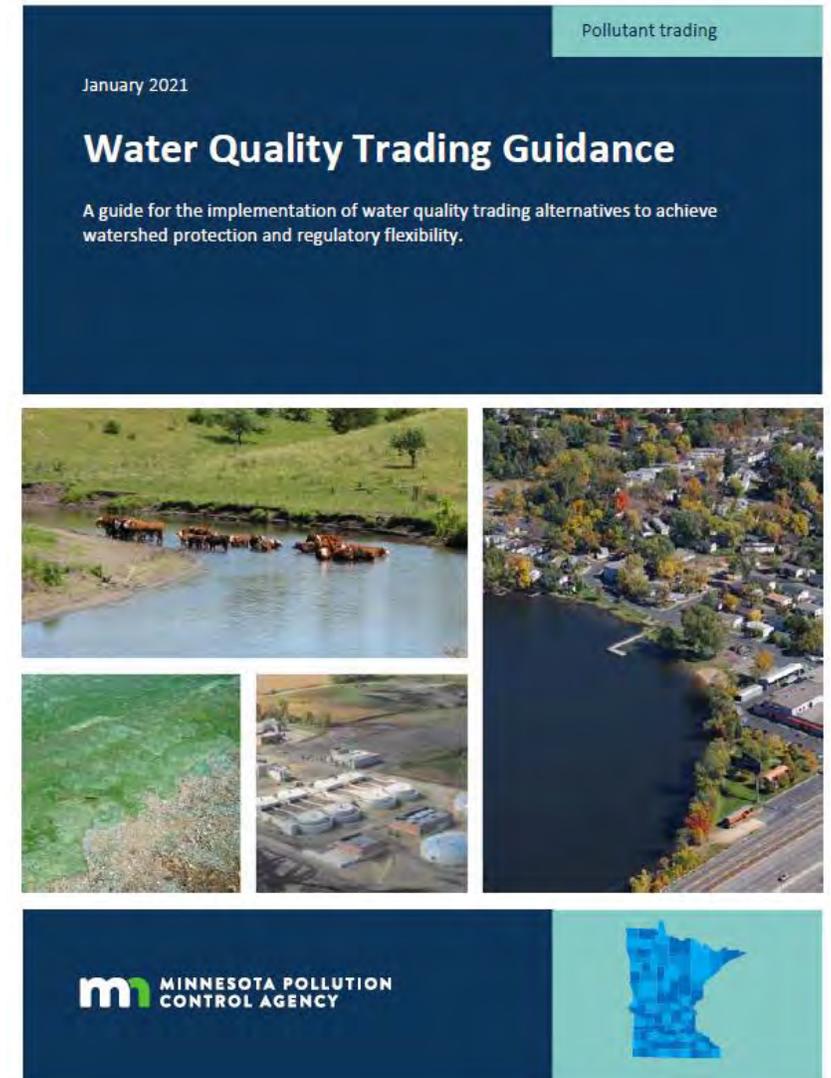

## How does it work in practice?

# Challenges with chloride trades

Yikes!

# How would chloride trading work?

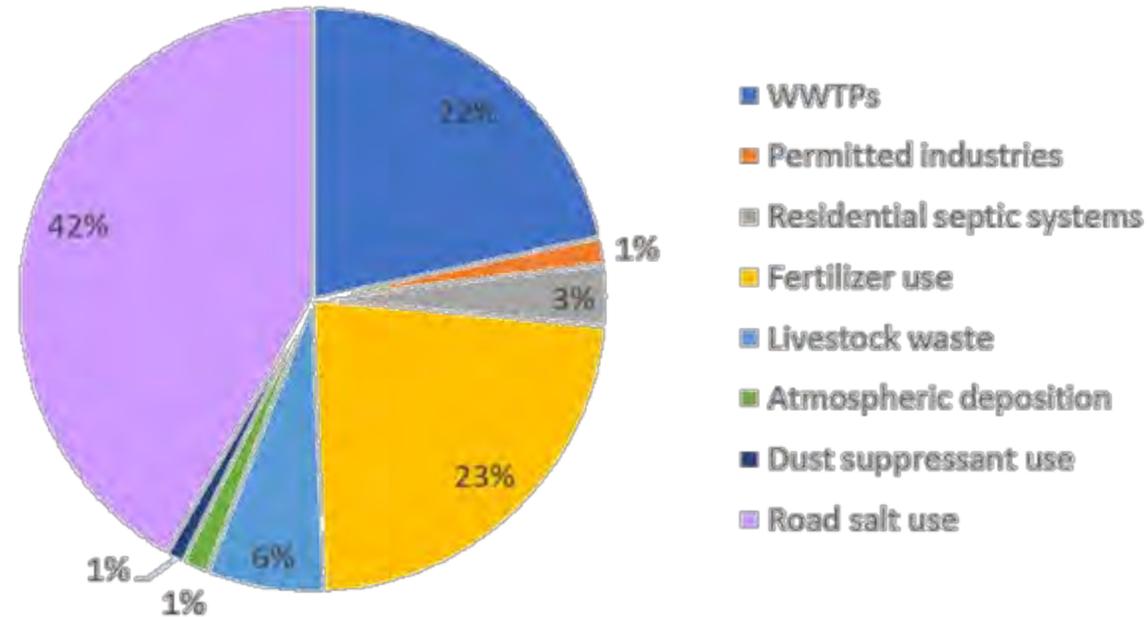

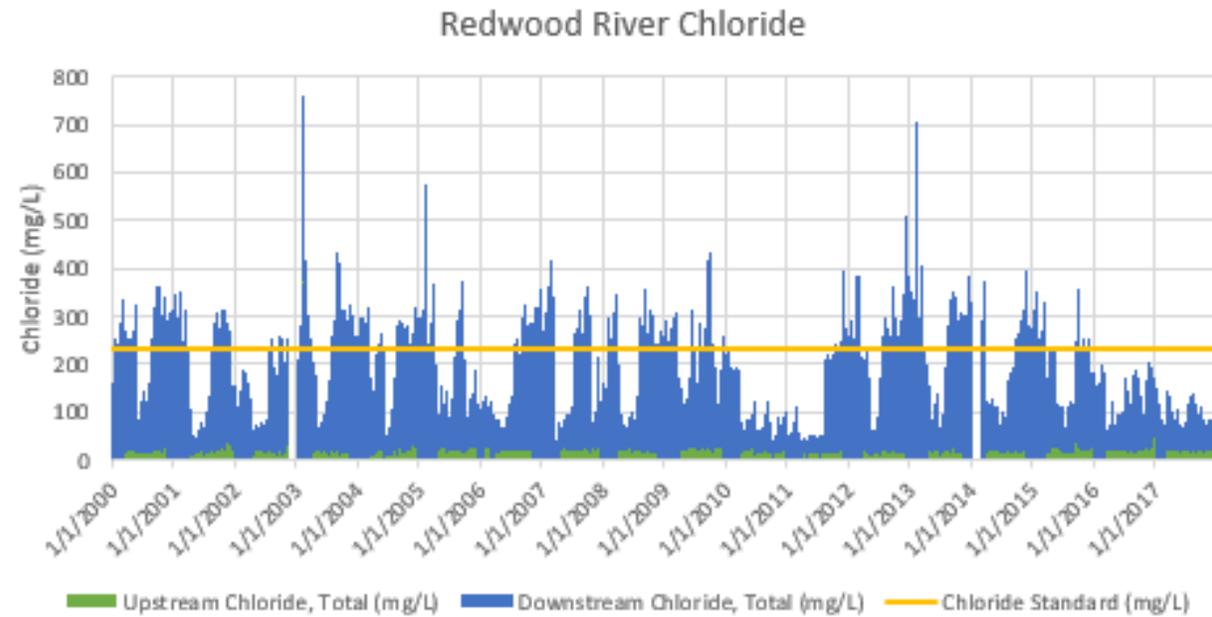

Figure 4: Fraction of annual chloride contributions from major point and nonpoint sources for State of Minnesota (Overbo et al. 2019)

\*Please note that Road salt use is actually all de-icing salt applied to roads, parking lots, sidewalks, and trails.

# Redwood River – Marshall, MN

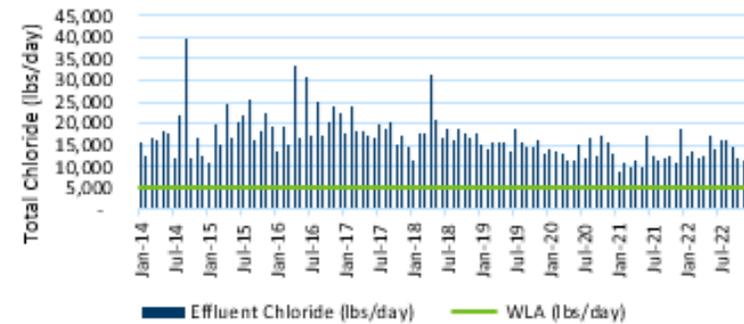

# Redwood River Chloride TMDL

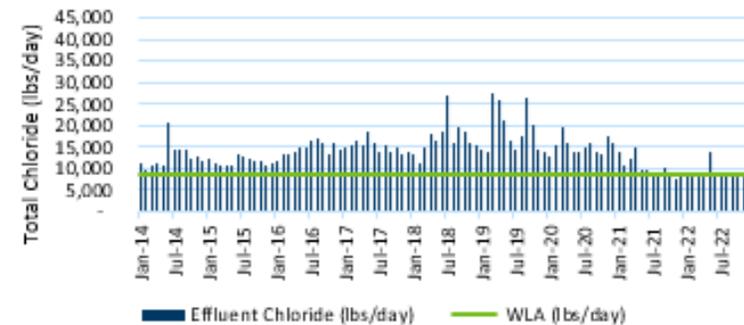

Table 32. Chloride TMDL summary for Redwood River Reach 502.

Chloride		Flow zones*				
		Very high	High	Mid-range	Low	Very low
Sources		Chloride load (lbs/day)				
Wasteload	ADM Corn Processing – Marshall (MN0057037)	5,064	5,064	5,064	**	**
	Lynd WWTP (MNG585030)	655	655	655	**	**
	Marshall WWTP (MN0022179)	8,632	8,632	8,632	**	**
	Russell WWTP (MNG585062)	1,124	1,124	1,124	**	**
	Magellan Pipeline Co LP – Marshall (MN0059838)	1,381	1,381	1,381	**	**
	Ruthton WWTP (MNG585105)	724	724	724	**	**
	Tyler WWTP (MNG585116)	2,091	2,091	2,091	**	**
	City of Marshall MS4 (MS400241)	18,304	5,588	1,753	**	**
	<b>Total WLA</b>	<b>37,975</b>	<b>25,259</b>	<b>21,424</b>	<b>**</b>	<b>**</b>
